

Coral LLC's "Daily D" Helps Keep Pregnant Women Protected from Deficiency

Typically early in pregnancy, your doctor or midwife will order a blood test to check Vitamin D levels. Why? Not surprisingly, your body needs vitamin D to maintain proper levels of calcium and phosphorus, which help build baby's bones and teeth, but [current research](#), according to WebMD Health News, also suggests that high doses of vitamin D during pregnancy can greatly reduce a pregnant woman's risk of complications, including gestational diabetes, preterm birth, and infection.

Unfortunately, [Vitamin D levels in pregnant women have dropped](#) over the last 20 years, probably due to less time spent in the sun. And while prenatal vitamins offer adequate supplementation of D, [women who are deficient may need an additional supplement](#), such as [Coral LLC's Daily D](#).

Delivering in each capsule a significant dose of 5,000 IUs of Vitamin D3, Daily D is *the only* supplement on the market to also offer 100 mg of calcium – beneficial for baby's growing bones, teeth, heart, nerves, muscles and more – from eco-friendly-harvested "above-the-sea" coral.

The inclusion of coral not only provides 10% RDA for calcium, but also doubles as the flowing agent, so **no artificial fillers or excipients are used.**

MSRP: \$18.95 for 100 veggie capsules. www.coralcalcium.com

For more information on Daily D or to request a sample, editorial media can contact Holly at On the Horizon Communications at (805) 773-1000; holly@thepressroom.com.
